HOW I GOT THE IDEA?

- Totally no idea from the beginning so i thought i just ask my TA, kailin. And she said reviews! So that's where the ideas start coming in… game reviews, restaurant reviews, food reviews, watches reviews, bags reviews, computer reviews, handphone model reviews.. So i thought since i like online shopping.. **I would just do reviews on online shopping sites.**

WHAT ARE THE PROBLEMS FACED?

- I was stuck at trying to display my first data from mongoDB for 3 hours. Even the simplest thing took me so long :(

- User can edit or delete other user's comments which they shouldn't

- Trying to make the logo of the shopping site to appear along side with the reviews that is being commented for.

WHAT I WANT TO ACHIEVE?

- Display all the shopping sites with details from database to the main homepage

- Users/non-users can click "read review" button under respective shopping site thumbnail to go to respective shopping site.

- In every respective shopping site, i want the page to display the details of the shop, when it was established, the website url. Reviews about that shopping site
  Will also be on that same page. Users **can write their reviews** and **edit their own reviews**. Non-users can **only read** other people reviews but not write their reviews **unless they sign up** as a user.

- Every user have a page whereby they can see all the reviews that they have commented for.

- A search box (that user can search the shopping site name and it will list down the comments coming from that shop) - NOT YET ACHIEVED
